##                                0
```

*#used to remove na in prev version*

```
man1 <- man
```

Many patterns or trends could be found as the dataset has plenty of variables that impact each other. In this model there will be a focus on sales price as the dependent variable in regressions. These first regressions will analyze the significance of relationships between sales price and variables such as GROSS.SQUARE.FOOTAGE, LAND.SQUARE.FOOTAGE, and NEIGHBORHOOD.

```

Many charts were plotted and counts of various variables were counted to get a feel for the data. had a lot of fun here mutating the data and using pipes to separate value such as month and day from the data and arrange the average neighborhood sales price by neighborhood in desc order. I finally analyzed the time variable of the sales date to see if there was any seasonality but the dataset was too small to see real differences. To add to this I broke applied a log function to the time series pricing data and grouped the points with differing alpha values dependent on their building class to further break down the data. This indicated large differences in the scale of value for building by class.

plot(resid(m2))

```

Overall the second model performed better and had more normal looking residuals. The adjusted  $R^2$  value was not that good only being 0.533, however the model did identify which key factors drove SALES by determining high significance in (LAND.SQUARE.FEET, GREENWICH VILLAGE-WEST, MIDTOWN CBD, MIDTOWN EAST, MIDTOWN WEST, and SOHO). This significance ultimately corresponded to the previous EDA as these neighborhoods all are those with the highest average SALES.PRICE.

- The KNN model ultimately did not work due to what i believe to be na values in the map means. I do believe that the regression part covered the signifigance test of the model and the plot of the plot line multivariate plot did correspond to predictions derived from the model. Overall the regression fit failed with a poor Adjusted R2 value and only was good at guessing the highest most affluent neighborhoods in addition to across the board factoring LAND.SQUARE.FEET.I do believe the KNN means would have performed with a higher accuracy and plotting directly onto ggmap to compare the regions would have been a great visualization. I do still think the regression enabled some insight into main factors. In addition, the EDA enabled some relationships to come to light such as building class and the effect of time. If this study was further explored I'd recommend more datapoints to explore seasonality.
